

A

PM_core (49 genes): per-cohort vs pooled

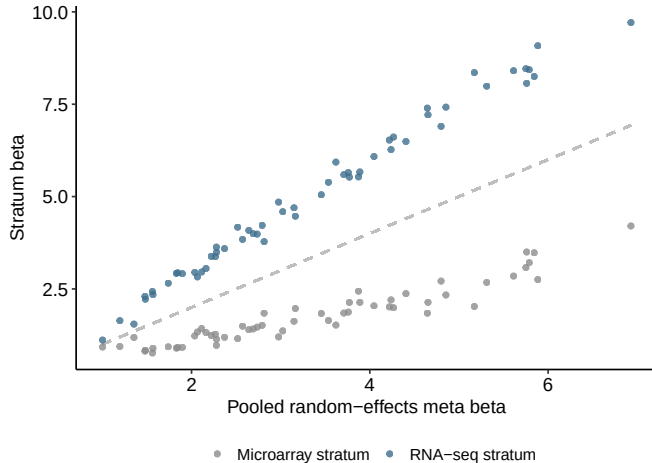

Spearman: GSE190609 (RNA-seq) $\rho = 0.88$; GSE225182 (RNA-seq) $\rho = 0.39$

B

LM_core (57 genes): platform strata vs pooled

Spearman: RNA-seq stratum $\rho = 0.99$; Microarray stratum $\rho = 0.95$

PM: only two RNA-seq cohorts contribute to the peritoneal meta-analysis, so platform strata reduce to single-cohort estimates.

LM: random-effects (REML) estimates within the RNA-seq stratum (GSE190609 + GSE50760) and the microarray stratum (GSE41258 + GSE41568), plotted against the pooled four-cohort estimate. Dashed line, $y = x$.
